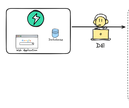
AWS GLUE MASTERCLASS

What is ETL/ELTL

We want to EXTRACT the data, and LOAD it somewhere and that loaded data should be TRANSFORMED as per requirements.

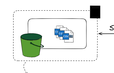


What is AWS Glue

AWS Glue is a SERVERLESS ETL/ELT solution available in AWS.

Components of AWS Glue

AWS Glue Catalog



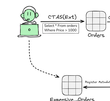
This catalog will register the metadata & schema of the files, and will create an object in the catalog.

External Tables

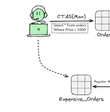
Table metadata lives in the catalog but the actual data is stored in the S3 bucket which is managed by you.

CTAS External

Create Table As Select



CTAS Managed



Traditional Definition

In External Tables, you own the data. That being said, after running the DROP command on top of your table, table won't be dropped from the S3. However, in case of Managed Tables, data will also be DROPPED.

AWS Catalog

In External Tables, you own the data. That being said, after running the DROP command on top of your table, table won't be dropped from the S3. In case of Managed Tables, data won't be deleted. But the S3 location will be picked by the def drop.

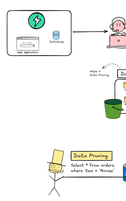
AWS Visual ETL



Incremental Load

Scheduling ETL

Native Scheduling

Event Based Trigger

```
import boto3, botocore, ?
# Initialize Boto3 client
s3 = boto3.client('s3')
# Get the source bucket
source_bucket = 'source-bucket'

def lambda_handler(event, context):
    # Create the Glue client using Boto3
    client = boto3.client('glue')

    response = client.start_job_run(JobName='incremental')

    return {
        'statusCode': 200,
    }
```
